

The Dangers of using Solar Panels

Solar Panels are marketed as being a 'Green Energy', a way of producing 'clean' energy while reducing Utility Bills at the same time as they are rising. Yet Solar Panels are anything but 'green' or 'clean'. In fact the way they work is very detrimental to ALL biological Systems because of the type of radiation emitted when collecting the 'energy' and converting it to a usable form of Alternating Current.

The main problem lies with the use of Inverters: these are used to convert the DC (Direct Current) Energy produced by the Panels into a usable AC (Alternating Current) Energy that can power our electronic equipment, with any surplus energy being shared back to the 'Grid' to reduce Utility costs.

Inverters produce very high EMFs; high magnetic and electrical fields which are hazardous to health. Inverters are also generally installed in the Loft area above where people sleep, exposing people in the home to these dangerous fields.

But this is not all. Inverters also produce extremely high levels of Dirty Electricity (DE), or EMI (noise/transients etc.). They produce up to 20KHz of Square Wave Modulation which is a completely unnatural form of energy that can have detrimental effects upon the body on many levels. This is the same type of modulated radiation we find in microwaves, Wi-Fi, Mobile Phones and Smart Meters. This 'type' of modulated radiation is detrimental to health and could potentially cause very serious illness and disease over time, as more and more scientific studies are concluding.

Yet this is not the end of the danger. Inverters are also designed to pass surplus 'energy' back into the Grid. This is how people save on their energy bills. All this 'dirty electricity' is therefore passed back into the 'Power Grid' and this 'dirty energy' is then delivered into every home that is on the same distribution supply. This endangers the lives of people living in proximity to houses that have Solar Panels fitted. Their houses become saturated with extreme levels of Dirty Electricity.

'Dirty Electricity' should only ever be 'produced' by equipment used in the home/office. The biggest culprits for this are CFL Light Bulbs, DECT Phones, TVs and Computers. Yet today we are seeing far more homes and offices with sky high levels of DE that are coming from external sources, like their power supply. Solar Panels are the cause of this electrical pollution that is damaging to every biological system.

However, if you live near a house with Solar Panels and are on the same electrical grid, then all you need to do is this: locate the very first Socket downstairs after the Fuse Box. Connect an extension lead to the socket and fit no more than four (4) DE Filters into that extension lead. It must be the first socket from the Fuse Box as we are trying to 'clean' the dirty electricity before it gets right into the house. Then you will need one more DE Filter for the Living Room and one for the upstairs main bedroom. You can check

out exactly how many De Filters you will need by using a Dirty Electricity EMI Meter which will show you the before and after measurements of DE so you can easily reduce the high levels to a safe low level.

So yet again it seems we've been conned folk, just like we have been conned with the benefits of using Low Energy CFL Bulbs and much more. We will be writing a more in depth article about the dangers of Solar Panels when time permits. In the meantime, if you have Solar Panels fitted or live nearby to those who have them fitted, then please contact us for more information and solutions if you have concerns.
